

Global & Regional Polls

A Paradigmatic Shift from “state-centric” to “global centric” Approach

NEW METHOD TO DO WORLD POLL

Synopsis

Background

In our view, the subject of global opinion polling is highly policy relevant. We feel that if we are able to standardize its methodology and apply it on a suitable range of subjects, it will greatly facilitate meaningful discourse among important segments of the global community and its increasingly globalized institutions and stakeholders.

Concept

In that background we have tried to standardize the methodology summarized as 'Global-centric method of sampling and surveys'. After considerable experimentation since the year 2000, we have arrived at a simple, but meaningful, conclusion: "As a principle, a global survey should treat the world (globe) as a unit and proceed to execute the standard principles observed in the conventional state-centric method. A number of adaptations are required. But in our view those do not alter the basic principles of sampling which are applicable to any group irrespective of its size."

Application

In its very essence the global-centric method treats the globe as one population entity and slices (stratifies) it rather than conceiving of the globe as a static mosaic of some 200 units (countries) from whom a selection is made (without disturbing the structure of units in the mosaic) to compile a multi-country survey. We argue that there is a paradigmatic difference between top-down approaches (SLICING), designed to start from the whole and choose a sample, and bottom up approach ('MOSAICING'), designed to choose from a mosaic and reconfigure it. We treat the former as global-centric and the latter as state-centric approach to measuring global opinion.

Tool Kit

We have developed a suitable tool-kit for the application of our 'Global-centric method'. It includes the following three tools:

Global Census Data Base:

We have pooled primary census data at block, or suitably available level, from 177 countries, constituting 99.5% of global population. Currently the pool has over 350,000 census blocks. Each block has identified its population size and its share in the total global population. The global census database provides the 'universe' from which we choose designated number of census blocks (for example 1000) to conduct a global poll.

Global Demographic Database

All sample surveys require a strong demographic information about the population of their universe. Hence we require a globally accumulated demographic data base. We have compiled a working demographic data base by drawing upon the existing sources. The raw information comes from national sources but the compilation and easy retrieval/reconfiguration makes it suitable a tool-kit require for global-centric surveys.

Global-centric Sample selection software

We have developed a modest but easy to use software which facilitates the selection of a global sample from the global census data base.

Sampling Procedure:

In principle the procedure is fairly identical to the conventional state-centric method. We choose a random number from the global population organized in a series. This provides the starting point. We choose the remaining census blocks through a sampling interval, choosing the block where the interval falls. The required number of blocks is determined by the Research Design, which in turn is guided by the unit of segmentation at which statistically reliable analysis is required. The entire global population is included in the series. The required number of sampling blocks gets chosen through the method of PPS (population proportionate to size). A designated number of interviews (say 10) can then be conducted in the statistically chosen census blocks across the world (say 1000). It provides a sample of 10,000 which should be a statistically reliable estimate of the global opinion. The opinions of its sub-units would be statistically reliable depending on the unit (or segment) of analysis. Our Global Census data base proposes a 3 tiered structure

of segmenting the world into 3 Zones, 10 Regions and 40 sub-Regions. The 40 sub-Regions comprise 19 single-country sub-regions (all the G-20 countries, with approx. 62 percent of global population) and 21 multi-country sub-Regions (together containing the remaining 38 percent of global population). Statistically reliable opinions can be available for any of the 40 units. The level of reliability can be raised by raising the total sample size or boosting a unit which needs special inquiry. Again, the segmentation scheme can be altered to suit research needs and orientation as long as the basic principles are not violated.

Conceptual Somersault

All of this is standard practice; and that is the key lesson. Our Global-centric method simply extends the standard/conventional sampling methodology by turning it upside-down at the starting point. It starts with the world and ends at a country (or equivalent sub-regional unit) rather than beginning with the country and adding up country data to compute global opinion. This conceptual somersault however requires a new tool-kit for translating Theory into Practice. The Global-centric method provides a 3 part tool-kit, constituting:

1. Global Census data
2. Global Demographic data
3. Global Sampling software

The need for such global tools has been explained earlier.

Conclusion

Our view is that a global sample of 10-20,000 men and women would provide a sound sample at global level and a fairly sound segment analysis separately for each one of the G-20 countries (19+ other EU) as well as the rest of the world clubbed into 20 sub-regional groups. Thus, global opinion for the world as a whole and its 40 constituent units can be measured through a relatively small sample (say 10- 20,000), at an affordable cost and fairly rapidly, within a week, if need be.

Following the same logic, Regional polls can be organized by selecting regional samples through global-centric method. We are currently working on a proposal with Asia Barometer to conduct an Asia Poll through the global-centric method.

Introduction

This paper is about the theory and practice of global surveys. It focuses on proposing a paradigmatic shift in multi country studies from a state-centric to a global-centric approach.

The paper has four sections which together explain the proposed approach.

SECTION

1

2

The **first two sections** deal with the '**Theory of global sampling**' which explains the difference between **state-centric** and **global-centric** sampling method. It also explains how we have developed a new geographical segmentation of the world and the justification for this new stratification. Moreover, it explains the procedures used to translate this theory into practice.

SECTION

3

The **third section** deals with the '**Practice of global-centric surveys**'. It provides a tool-kit which is required to translate the above mentioned theory into practice. This chapter explains the three tools: Global Census Data Base, Global Demographic Database and Global Sampling each of which forms a section in this chapter.

SECTION

4

The **fourth section** deals with the '**Tests of global sampling**' which provide evidence for the validity of the theory of global sampling. It makes a case for global-centric sampling by applying a series of tests on Asia Barometer as a case study.

01

Theory of global sampling

This Section explains the Theory of Global Sampling. It has two Sub-Sections. Sub-Section 1 deals with key concepts. Sub-Section 2 explains the basis and development of a global-centric segmentation of the world.

Basic Concepts

Since the turn of the century we have seen a rapid rise in what are considered multi-country studies. We have examined multi-country opinion polls by a number of organizations including Gallup Organization (USA), Pew Foundation, World/Public Opinion, and Gallup International Association – Voice of the People, on the one hand and Ipsos, TNS, ACNielsen on the other hand. The former focus mostly on social and political issues, while the latter focus on general lifestyle and consumer behavior issues. They carry out their field work through a mix of modes which we can refer to as multi-mode (or Hybrid) methods, including Face to Face, CATI and Online. In addition to the types of global surveys mentioned above there is also another genre of multi-country surveys which are named as “Barometers”. The term barometer was first introduced by Euro-barometer in 1974 for a survey of countries which were then members of the European Community. Since then other regions have followed suit and we now have Asia Barometer, Latino Barometer, Africa Barometer, Arab Barometer and possibly others. All of them are multi-country surveys which take periodic measurement of opinion in their respective Regions. There is a third genre of University base global surveys. The World Value Survey led by Professor Ron Inglehard at University of Michigan, and International Social Science Survey, led by Dr. Tom Smith at University of Chicago are the most notable in this group.

As evidenced by the analysis of over 100 polls of last two years, almost all world-wide polls treat a country as the focus of analysis. They are all based on a state-centric paradigm. Our paper raises the question: are these polls of countries or polls of a global population; in other words: what is the universe that they set out to poll? We conclude from them that such polls are strictly speaking multi-country polls; not global polls. They do not define a universe at the start of the exercise in their objectives, nor often in their analyses, or even by the end of them. In a nutshell, these polls generally do not define the universe that they set out to poll.

Contrasting world-wide polls with the national polls, we can obtain a better understanding of where multi-country polls do not follow a standard method of sampling. When conducting a national survey, one would normally start with the highest level as the starting point, meaning we first state the highest point as the universe, stratify it, sample it and then proceed to analyze at a lower level, such as a district, where necessary. We do not start with the ‘district’ and treat national survey as the sum of their district surveys, like the methodology followed in global surveys. Due to this problem of the ‘state-centric’ model of sampling in the global surveys, we end up producing global surveys with NO GLOBAL AVERAGE. We get an assortment of findings for individual countries or a collection of them only. This would be comparable to doing a survey on performance rating of a US president and producing results for US counties/districts and states without giving one figure for all of the US.

We want to work out an 'alternative global paradigm' to conduct global polls. Its principal premise is that in order to become scientific exercise global polls should follow the standard principles of national polls and modify where needed according to statistical theory.

Proceeding with this approach, we undertake standard steps prescribed to do any poll, but extend the scope of the universe from 'state' to 'global' population. Thus, the steps are: first define the universe, then stratify, choose randomly from the strata and conduct the interview. This comprises the data collection phase. Our analysis begins with the results for the total population, but it can also provide segment analysis. The country samples will now serve as segments. The statistical validity of analysis will depend on the size of the sample in the segment we wish to analyze. This can be a single country or (if we require) any group of countries. Thus the overall size of the "global" survey will depend on the requirements of our segmentation analysis as it is also the standard procedure in the 'state-centric' paradigm.

While proceeding with this exercise, it became evident that the key test of validity is:

- 1** - To come up with a stratification scheme whereby we can carry out random selection of respondents in all countries of the world or those in which the locations may fall by virtue of probability proportionate to size method;
- 2** - The interviews in selected strata may not be in proportion to the size of the stratum in the global population. This would require re-weighting. Once the weights are applied, the profile of the weighted sample should correspond with the profile of the universe. This can be done by matching the two profiles, that is, global population profile and the selected sample profile.

Our strategy starts with the globe as a unit. It treats units within countries as a single continuity and thus creates sampling blocks or districts for the entire world. Presently, there are nearly 350,000 units. It then proceeds to select 'sampling blocks' from the whole world according to their share in the global population. In one sense it prepares a list of 7 billion persons, irrespective of their country and selects all persons (or as per instructions) by assigning a predetermined interval. For example, it chooses from a population of 7 billion, every 700,000th person randomly to choose a global sample of 10,000 people. Once chosen, the sample is listed by the country in which the person is located. Each country gets a share in the sample proportionate to its size in the global population. Some countries will have a sample too small to justify statistically significant findings for their own territory. But that is also true for small territories in national samples, and there are ways to address this issue. For example, we can lump them with others, when appropriate, so they can be analyzed as part of a larger group; we can also over sample them and reweight the data according to their census share when aggregating them to get national averages. Other solutions can also be worked out for samples in a 'global paradigm' just as they are for 'state-centric samples'.

Challenges and their solutions:

Moving from a 'state-centric' to a 'global-centric' paradigm poses a number of challenges. The first challenge is to provide an alternative list of concepts and tools to replace the ones used in the conventional

approach. The second challenge is to present a convincing case for the paradigm shift. Lastly, we have to provide a set of tools to replace or supplement the tools which facilitate current sampling methods. Below we shed more light on these challenges:

1. We need to develop a theory for Global sampling, as a variant on theory for National sampling. Currently world-wide or global surveys are surveys without a theory, and hence they are unable to define either their 'universe' (a list of countries is not an appropriate universe) or their 'stratifying' segments. Thus, in the findings of such surveys, they present their segmentation analysis without much scientific or logical grounds. Their Methods Reports rarely, if ever, mention why they have chosen to sample the countries they have. In short, no scientific procedure is specified to select or sample the countries included in the survey. A theory of Global sampling as developed by us will address all of these issues.
2. We need to create a 'global universe' of population based on National Census data. While no global Census is conducted, a collection of national censuses can serve that purpose. However no such consolidated record is available or accessible. One needs to undertake a major task of consolidating a 'Global Census' by putting together Census data files of national census bodies.
3. There is also the issue of whether we should use the existing national census categories for their sub-national strata or build a fresh stratification scheme? In our view, we should build upon the sub-national strata provided by commonly known administrative units in the existing national census data. If one were to use new and more novel units, it would be difficult to generate blocks of population and orient field work with reference to them. To give an example, the sampling plans of many countries are based on the units of their administrative provinces, states, districts, countries, municipal precincts, revenue villages etc. Hence, it is necessary that while searching for a stratification scheme one does not severely depart from the existing administrative classifications. Our combined global census data base and software takes care of this problem in a manageable fashion. See Chapter 2 on "Tools of Sampling" ahead.
4. We require demographic data bases in a 'global paradigm'. All sample surveys require detailed demographic information to verify and validate their survey findings. Thus we need demographic data bases in a 'global' paradigm. These global demographic data bases can be built by drawing upon various accumulations which are currently available. For example, the World Bank Annual Development Report Tables provide key demographic information on all countries of the world. They provide information on population size, gender distribution, per capita income, literacy rates, access to utilities etc. Certain other global statistical studies do the same; for example the Annual Human Development Report produced by UNDP goes a step beyond the World Bank on social indicators such as access to education, clean drinking water, fertility rates, age distribution etc. We also found other national sources such as the publicly available CIA Fact Book. This Fact Book made available by the US government on the web compiles a range of demographic and socio-economic data from

open national sources and presents them in a coherent fashion under country listings. Then there are the National Census Reports, which we have collected from nearly 177 countries. Thus, drawing upon a number of sources we have compiled what we are calling “A Global Census” and Demographic data base.

5. We also need to demonstrate that a paradigm shift from state-centric to global-centric approach has benefits in terms of cost, speed and efficiency. We have tried to accomplish this by providing “scientific tests” on Asia Barometer data. The details are given in Chapter 3.

The next section throws further light on explaining and addressing various issues pertaining to these challenges.

02

Method to define &
stratify the universe
for Global Surveys

Method to define & stratify the universe for Global Surveys

2.1 Coming up with a meaningful geographical stratification or segmentation of the World

We have been searching for a method to stratify the more than 7 billion people on the globe into a set of meaningful units which would serve as the strata whose representative samples would constitute a representation of the whole world, that is the global population. This stratification is complicated because the currently used primary units (countries) are very uneven in size. There are some 206 countries in the world. These include countries as large as China and India, each housing more than a billion people, to as many as 9 countries, which house less than a billion but more than a 100 million, and 71 which house less than 100 million but more than 10 million people; still another 73 countries have less than 10 million but more than 1 million people, 22 countries whose population is less than a million but more than 0.1 million, and that leaves as many as 29 countries whose population is less than 0.1 million people.

No. of countries	Population Range
2	More than 1 billion
9	Less than 1 billion but more than 100 million
71	Less than 100 million but more than 10 million
73	Less than 10 million but more than 1 million
22	Less than 1 million but more than 0.1 million
29	Less than 0.1 million

Furthermore the units are very uneven in other population characteristics. For example, a small country such as Norway, with less than 5 million of population, has considerable weight in economic power disproportionate to its population size. To complicate the scene, the constituent units in the universe are highly diverse in their politics and culture. No single characteristic seems to a suitable basis for meaningful clustering of units into groups. Many experiments of clustering countries into groups were made by us, but on close examination they did not appear appealing.

Clustering on the basis of population size, economic strength, cultural cohesion all produced groupings which were either not meaningful or not practical to work with as a unit, for the purposes of information gathering, reporting and summarizing. These three functions were seen as important objectives in this exercise of creating a stratification of the global universe, amenable to practical sampling and field work. The meaning of “practical” was defined as: “Easy to administer within the resources available to an academic, corporate or media organization, which conducts opinion and marketing research in multiple countries and across continents”. The “practicality” also rests on devising a plan in which the existing administrative units can be easily accommodated.

The prevailing political geography (we refer to it as the conventional map) did not provide a meaningful answer to our predicament. While engaged in this search we have examined other classifications provided by Regional groupings used in the United Nations, the World Bank, Regional organizations such as the European Union, African Union, South American States, Organization of Islamic Countries (OIC), G8, OECD, G20, BRICS and many others. None in itself, provided the basis for developing a hierarchical, mutually exclusive stratification system such that the units from which further selections are to be made can meet the following conditions: 1- The Sampling units, which would serve as the unit from which randomly chosen respondents are to be interviewed, should contain countries which are relatively homogenous, that is, they should have greater similarity with each other than other groupings in their vicinity. 2. The Sampling unit should not be too large, because in that case the number of units will be too few and may not be well spread out across the geographic and socio-economic dispersion of the universe. 3- The sampling units should not be uneven in size from each other.

Given these objectives we muddled through a trial and error method, experimenting with various global classifications. At one stage we grouped the world into 13 cultural zones based on geography, history and cultures. We then divided each of the 13 groups into two halves, on the basis of Top half and Bottom half in terms per capita income of the countries included in each cultural zone. This gave a list of 26 groups, half of them wealthier than the other half within their own cultural zone. But there were several problems with this classification. Some units were far too big than others. The method of dividing countries into the Richer and Poorer half of a zone was difficult to administer despite the fact that we chose the World Bank provided per capita Income (Purchasing Power Parity/PPP version) for all countries as the dividing criterion. The practical implementation was also difficult as for some countries the information on per capita income was either not available or lacked credibility. In other cases per capita income was a poor indicator of their level of development. As none of these schemes appeared to be appropriate, we turned to the following option, which includes all countries of the world and classifies them into various units, not for selecting a sample but for analyzing or weighting the achieved data.

A Modified Political Map of the World (Maps shown at the end of this section)

We have divided the world into 3 geographical Zones, 10 Regions and 40 sub-Regions. This zoning is

neither fixed nor eclectic; instead we group regions according to different traits and characteristics that give them a special affinity with each other. The exact traits and characteristics used to group countries together differ case by case according to what makes most sense for analyzing current social, political and economic developments in the world.

Our first Zone is Asia inclusive of North Africa. From its Eastern borders in Japan and the Koreas in the North to the Philippines and Indonesia in the South, to the Western most parts in Turkey and the Middle East spilling over to parts of North Africa, this is by far the most populous zone of the world. It constitutes nearly two third (64%) of the entire world's population. It is further divided into 5 Regions, and 16 sub-regions, each with fairly distinct cultural and political tendencies, and we shall turn to those details at the appropriate place. The Asian Zone comprises of 61 countries in the universe of our study.

Our second Zone is **sub-Saharan** Africa. Leaving aside the Northern and Northeastern Arabic speaking Africa, the sub-Saharan Africa which constitutes this zone comprises 11% of the world's population, housed in 48 countries.

Our third Zone is Europe (Including Russia), the Americas and Australasia. This zone is spread over a vast landmass but constitutes only 25% of the world's population, housed in 73 countries (leaving aside the very small political entities mentioned as exceptions elsewhere).

Most sources list around 206 countries in the world including very small political entities and dependencies. We have included nearly 177 of those in our universe constituting **99.95%** of world population. The remaining 29 are small countries and dependencies. They house **0.05%** of world population.

Since our zoning is a mixture of geography and other factors, we have included entire Russia (and not just its Western parts) in this zone. In fact, all of the former Soviet Union, except the 6 countries of Inner (central) Asia, is included in this zone.

The three zones of the world are not only unequal in the size of their population but also in their past and current economic conditions. The following tables are illustrative. Table 1 gives the zonal picture whereas Table 2 and Table 3 give the Regional and sub-Regional picture respectively, in terms of population distribution.

As we proceed we shall dwell on the profile, politics and society of Regions and Sub-regions of each of the three Global Zones, beginning with a look at two key demographics, namely, population and economic characteristics at the three levels: Zones, Regions and Sub-regions.

Table 1
Global Classification at Zonal Level

	Percent in Global Population	Population (in figures)
Zone 1: Asia	64%	4,290,548,534
Zone 2: Africa	11%	732,733,712
Zone 3: Europe Americas and Australasia	25%	1,650,494,025

Table 2
Global Classification at Regional Level

	Percent in Global Population	Population (in figures)
ASIA		
Region 1: Middle East and North Africa	5%	351,978,838
Region 2: Western and Central Asia	6%	407,803,460
Region 3: South Asia	21%	1,401,010,362
Region 4: Southeast Asia	8%	553,587,366
Region 5: Northeast Asia	24%	1,576,168,508
AFRICA		
Region 6: Africa	11%	732,733,712
EUROPE, AMERICAS AND AUSTRALASIA		
Region 7: North America	5%	337,037,342
Region 8: Latin America	9%	573,874,759
Region 9: Western Europe*	6%	400,805,611
Region 10: Eastern Europe	5%	338,776,313

* For statistical computation, Australasia (Total Population: Approx. 25 million; 0.40% of world population) is clubbed in this region.

Table 3
Global Classification at Sub-Regional Level

Note: A sub-region can comprise one country or a group of countries, depending on mixed criteria of population, economic status and other related characteristics

	Sub-Regions	% Share in World Population	Population in figures
I-	North America	5%	337,037,342
	1. USA	5%	303,824,646
	2. Canada	0.5%	33,212,696
II-	Latin America	9%	573,874,759
	3. Brazil	3%	191,908,598
	4. Argentina	1%	40,677,348
	5. Rest of South America sub-region	2%	151,794,871
	6. Mexico	2%	109,955,400
	7. Other Central American sub-region	1%	41,283,659
	8. Caribbean sub-region	1%	38,254,883
III-	Western Europe	6.8%	400,805,611
	9. UK	1%	60,943,912
	10. Germany	1%	82,369,548
	11. France	1%	64,057,790
	12. Italy	1%	58,145,321
	13. Rest of Northwestern European sub-region	1%	47,478,442
	14. Rest of Southern European sub-region	1%	63,086,913
	15. Scandinavian Europe sub-region	0.4%	24,723,685

	16. Australasia sub-region*	0.4%	20,600,856
IV-	Eastern Europe	5%	338,776,313
	17. Russia	2%	140,702,094
	18. South Eastern Europe sub-region	1%	59,244,125
	19. Central Eastern Europe sub-region	1%	64,107,929
	20. Former Soviet Eastern Europe sub-region	1%	74,722,165
V-	Africa	11%	732,733,712
	21. South Africa	1%	43,786,115
	22. Rest of South African sub-region	2%	100,305,069
	23. Nigeria and rest of West African sub-region	4%	271,413,906
	24. Kenya and rest of East African sub-region	3%	192,817,537
	25. DR Congo and rest of Central African sub-region	2%	124,411,085
VI-	Middle East and North Africa	5%	351,978,838
	26. North and East African Arab sub-region	3%	220,763,618
	27. Middle Eastern Arab sub-region	1%	67,863,648
	28. Saudi Arabia	0.4%	28,161,417
	29. Rest of Gulf and Peninsular Arab sub-region	1%	35,190,155

VII-	West Asia	6%	407,803,460
	30. Turkey	1%	71,892,807
	31. Iran, Afghanistan, Pakistan sub-region	4%	266,375,639
	32. Central Asian sub-region	1%	69,535,014
VIII-	South Asia	21%	1,401,010,362
	33. India	17%	1,147,995,898
	34. Rest of South Asian sub-region	4%	253,014,464
IX-	East Asia	8%	553,587,366
	35. Indonesia	4%	237,512,355
	36. Rest of ASEAN sub-region	4%	295,474,155
X-	North Asia	24%	1,576,168,508
	37. China	20%	1,330,044,605
	38. Japan	2%	127,288,419
	39. Korea	1%	49,232,844
	40. Rest of North and East Asian sub-region	1%	69,602,640
	TOTAL OF 40 SUB-REGIONS	100%	6,673,776,271*

Notes:

1- For statistical computation Australasia is classified in this Region. See explanation elsewhere

2- These figures are based on total world population estimated at approximately 6.7 billion. Since then the global population has risen to 7 billion (2012 estimate)

2.2 The Logic of our Classification

Classification of the world into 3 Zones, 10 Regions and 40 sub-Regions is based on the following rationale or logic.

The Logic of Zonal Distribution:

The world is grouped into 3 Zones because of a mixture of geographic, cultural and historic reasons.

Geography makes the Asian continent an identifiable unit and the same goes for Africa. In the case of Africa we have made a minor modification due to cultural and historic reasons: The Arabic speaking North Africa blends in with the Asian Middle East as much as, or perhaps more than, it does with sub-Saharan Africa. Hence, 10 countries of North and Northeastern Africa (all members of the Arab League) have been grouped with the Asian Middle East. Thus, the Africa zone in this new map is what is commonly known as Sub-Saharan Africa. That leaves four other continents: Europe, the Americas and Australia. We have grouped them together as a third zone of the world on grounds of, again, cultural and historical reasons. Europe forms the historic origin of this Zone as the contemporary populations of both Americas and Australasia (Australia and New Zealand) are the successive generations of European migrants. We have also included all of Russia and its Slavic or majority Christian neighbors (Ukraine, Belarus, Georgia, and Armenia) in the European centered Zone 3 of the world.

The Logic of Regional Distribution:

Within each Zone there is more than one Region. Thus North America and Latin America are two clearly identifiable Regions in our Zone 3. Similarly, Western Europe and Eastern Europe (inclusive of Russia and its former Soviet neighbors) are another two identifiable Regions. Thus, Zone 3 constitutes 4 Regions, which while sharing some common characteristics are sufficiently distinct from each other to form separate Regions within the Zone.

We have taken all of Africa (sub-Sahara) as one Region. There are however, as we shall see below 5 sub-Regions in Africa.

As for Asia, we have classified it into 5 distinct Regions. Since Asia houses nearly 64% of world's population, it is only understandable that, notwithstanding some common characteristics, there would be considerable differences between its various parts. These parts or Regions are first, the Middle East and Arabic speaking North Africa and all countries in this Asian Region are members of the Arab League. The second Region extends from Turkey to Pakistan and includes the 10 member countries of a cultural and economic cooperation organization called Economic Cooperation Organization (ECO). These 10 countries are largely Turkish and Persian speaking or speak Turko-Persian influenced languages. We call this the West and Central Asian Region. The 3rd Asian Region is South Asia. It includes India and its six other neighbors. All but one of them, Burma, are part of a regional organization, South Asian Association for Regional Cooperation (SAARC). The 4th Asian Region corresponds with the Association of South East Asian Nations (ASEAN), comprising of the nine members of ASEAN. As is quite apparent, our Regional classification draws upon an existing affinity expressed through their bonding in a regional organization as well as certain cultural and historical affinities. That provides us the rationale to group them together.

The 5th Asian Region is one of the most populous regions because it includes China, Japan, the Korean peninsula and other relatively smaller nations in the Pacific Ocean. Once again we stress that Asia's five Regions have adequate internal similarity to be grouped together and sufficient differences from the rest of their Asian counterparts to form a separate Asian Region.

The Logic of Sub-Regional Distribution:

Each of the 10 Regions into which we have classified the globe contains differences within it, and it would be justified to group them further into smaller sub-Regions based on the principle of relative homogeneity within the sub-regional group and distinction from other sub-regional groupings in the same Region. While doing that we have taken into account several considerations. In nearly half the cases we have treated a country as a sub-region either because of the weight of its population, or because of its distinctive economic weight. On both accounts we found it appropriate to treat it as, what sampling statisticians call “self-representing units”. They are sufficiently large or distinctive as to be treated as a stratum on their own rather than be grouped with other units to constitute a stratum.

The extreme case of China would be self-explanatory. It is nearly 17% of the global population and hence it would be appropriate to treat this unit differently from other smaller nations in its Region, and the same would apply to India. For the reason of their weight or importance in global economy, both Japan and Korea would require a similar treatment. We have chosen an easy rule of thumb and treated each one of the 19 states which constitute G20 (the 20th is the EU) as self-representing units or sub-Regions within their own Region. These 19 states or units of the globe are so large in population that they constitute 62% of the globe’s population. Once each one of them is treated as a sub-Region we are left with 38% of the world’s population, which includes a large number of states or units (156 states) that are to be grouped into sub-regions. Based on their characteristics, including the size of population, geography history, culture and population characteristics we have classified them into another 21 sub-Regions.

This process of creating sub-regional groups varies from Region to Region and is done not by any one common grouping principle, for that would not be appropriate. Instead, while the classification method adheres to the broad principles stated above, the grouping principle is specific to its own Regional peculiarities as well. Nevertheless, since 38% of the globe is grouped into 21 sub-regions (other than the single country self-representing sub-regions) none is very large. The average share of a sub-region in the global population falls under 2%. That fact increases their chance of being internally homogeneous and distinct from other sub-regions in their regional vicinity. It also increases the probability that these sub-regions would be spread out in various types of areas on the globe.

As Table 3 shows these 21 sub-Regions are so divided that 15 of the 21 have 2% or less of global population while the remaining are equally divided between clusters (or stratum) of 3% and 4% of global population. As a rule they constitute a small enough cluster, with relative internal homogeneity, to qualify as a basic sub-region (or cluster) of the globe. It is this Primary Unit, which we have designed as the building block to develop a statistical “universe” of the global population. This “Universe” constitutes 19 self-representing Primary Units and 21 clusters (sub-regions) representing 156 countries but only 38% of global population.

In summary, a new political map of the 21st century not only provides a coherent framework in order to understand the new political, socio-economic and cultural realities, but also provides the basis for designing

a global stratification of nearly 177 countries or units into 40 strata. This stratification can then be used for selecting sub-units whose random samples have a high probability of generating representative samples of the global population. The need for such a sampling method has been felt for nearly half a century, but an appropriate instrument was never designed to implement it.

Our present exercise of developing a global sampling framework was initiated in the year 2001. The idea was first presented in a professional meeting in Prague in 2001. It was then followed up with more detailed statistical tables and a discussion with professionals in Johannesburg, South Africa in 2002. After considerable experimental work the subject was again raised with a number of scholars in the United States in 2005 at MIT, Michigan, Connecticut and Chicago Universities.

Have we found what we were looking for?

In our assessment we have at least developed a road map and traveled a part of the path that we are convinced is the right one. We are quite confident that we have defined the universe correctly; we have developed a logical stratification or classification scheme which is suitable and practical for purposes of polling global adult population. We have developed a global demographic database, so that the estimates from a global sample on key demographics can be tested for matching with their parameter values as provided in the global demographic database. Furthermore, we have a process to experiment with global surveys to assess the following:

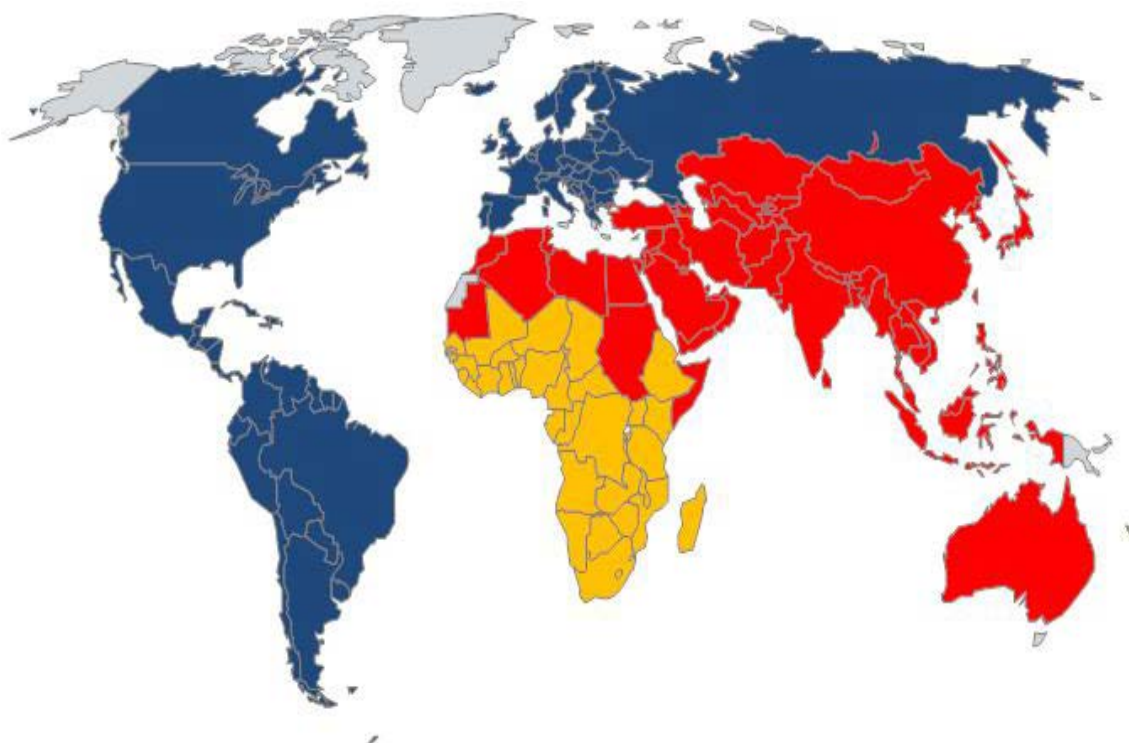

1 - Level of Coverage: This determines the percentage of the global adult population that is our universe, which is covered by the assessed survey.

2 - Level of Representation: This determines the extent to which the un-weighted global sample is representative of global population on key demographic variables including gender, age etc. We then re-weight the data according to our “global weighting scheme” and see the level of correspondence with the universe values on the same variables.

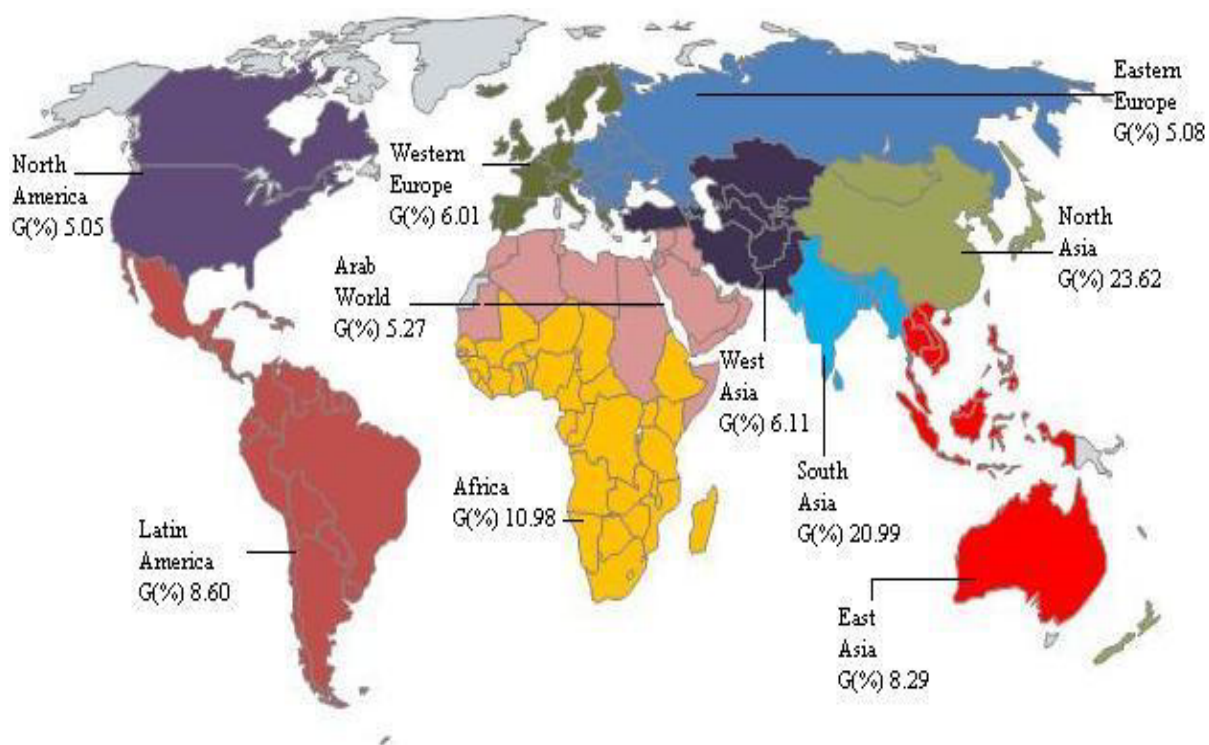

Our road-map is to carry out more experiments along the lines described earlier, and to revise and refine all processes according to our Global-Centric Sampling Method.

This new sampling method which draws upon a modified political map of the world is helpful for both opinion polling and its data analysis.

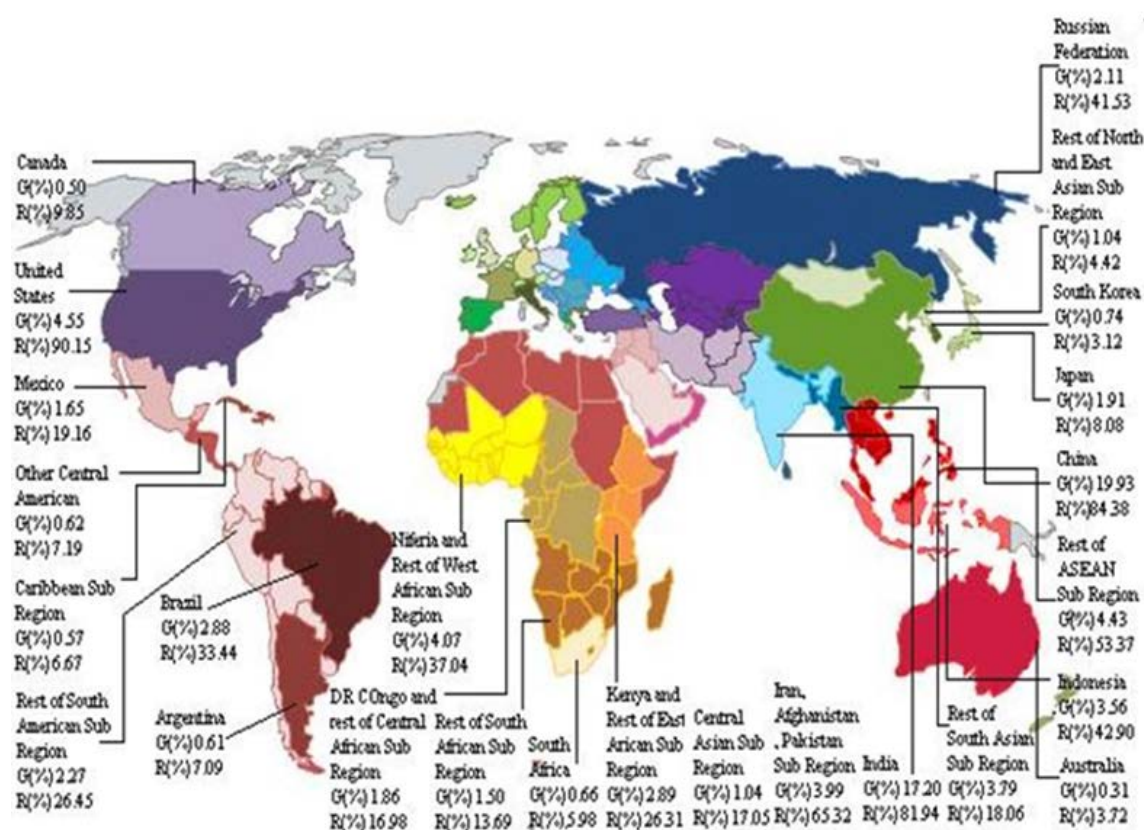

3 ZONES

10 REGIONS

40 SUB-REGIONS

This Chapter presents a set of tools which help us transform the theory of global sampling into practice.

It has three sub-Sections. Sub-Section 1 explains Global Census; Sub-Section 2 is about the Global Demographic Database while Sub-Section 3 deals with the Global Sampling Software.

A Global Census

Shifting from a 'state-centric' to a 'global-centric' paradigm poses certain challenges. One such challenge is the need to create a 'global universe' of population based on National Census data. While no global census is conducted, a collection of national censuses can serve this purpose. However, no such combined record is available or accessible. It is imperative to undertake the foremost task of consolidating a 'Global Census' by merging Census data files of national census bodies.

As part of this Global Census Exercise we searched for the national Census Data of all 177 countries. We found data for 176 countries. This was from the official websites of National Statistics Organizations/Census Bureaus of the respective countries which gives the census data for their country. These have the latest census data or the projected data from the last conducted census. The census data can be based on actual census or register based census. It gives information about a number of indicators related to population and housing characteristics. But for the Global Census Exercise we restricted our focus to recording the population counts for the various administrative units of the country, the purpose being to list its population units which could be used as strata for sampling purposes. We also used National Census Reports, which we have collected from nearly 80 countries (the process of acquisition is continuing). Thus, drawing upon a number of sources we have compiled what we are calling "A Global Census".

National Population Hierarchy

Every country is divided into a certain number of administrative units. These units follow a hierarchy. For example, country 'A' has a total population of X. We designated this national population as **level 1**. Then this country A has 4 provinces with population Xa, Xb, Xc, Xd respectively. These constitute the **level 2** population. Furthermore, a province is divided into 20 districts thus adding up to 80 such districts in total with populations: Xa1 – Xa20, Xb1 – Xb20, Xc1 – Xc20, Xd1 – Xd20. These 80 units will provide the **level 3** populations for Country A. Following the procedure there is level 1, level 2, level 3, level 4 and so on of populations for all of the 177 countries, constituting our Global Census.

We searched for population information for all the 177 countries according to the levels/administrative divisions described above. If only national/country population was available, we termed it as "Low Level Information". If information was available up to the level 2 of Administrative Divisions (e.g. province in previous example) we termed it as "Medium Level Information". If information was available up to level 3 of Administrative Divisions (e.g. district in previous example) or even beyond that e.g. level 4, 5 we termed it "High Level Information". At this stage our target was only the names of the Level 2/Level 3 locations and total population of that location. We ignored the details such as demographics, education, and other socio-economic characteristics for the population living in those locations. Consequently, we came up with High,

Medium and Low data for 102, 74 and 1 countries respectively.

In order to document this search exercise a template was made. For each of the 177 countries we noted the name of the country, the website address where census information was available, and then a brief search route for reaching to the required data, the form in which data was available, and the level at which the latest year/census year for which this data was available.

Drawing a Random Sample

After we had located the population census data for 177 countries of the world, the next step was to organize this data into such a form so that a representative sample of the world could be found. We divided this phase into 2 parts: 21 sub-Regions (other than G19 countries, except Australia); and G19 sub-Regions (excluding Australia).

As we have 21 sub-Regions of the world which are multi country, that is, each sub-Region has at least 2 or more countries, our aim was to make one Excel sheet for each of these 21 sub-Regions such that the population data for all the countries present in that sub-Region is combined in that sheet.

Then we proceed to part 2 of our exercise for G19 sub-Region (excluding Australia which has been covered in Australasia in the 21 sub-Regions discussed previously). Each of these 18 sub-Regions has one country per sub-Region. Data was downloaded for the smallest level of the administrative division available for that country/sub-Region. This data was saved in a separate folder for each sub-Region. An exclusive Excel Sheet was made for each of the 18 sub-Regions. Again, the information was listed according to country names, levels, and population at each level. Hierarchy and total number of administrative units was also noted just like in the first part of the exercise.

As discussed earlier, each of the 40 sub-Regions makes up a certain percentage of the total world population which adds up to 100 percent in total. Now we arrive at the phase of sampling: to draw a sample of the whole world. Our required sample size was 10,000. We aimed to do 10 interviews at each location. So we needed to select 1,000 sample points distributed across the 40 sub-Regions according to the population size of each sub-Region.

This was carried out in the following steps:

1. Determine the number of sample points (SP) we needed for each of the 40 sub-Regions (out of a total SP=1,000)

This is done by multiplying the share percentage of that region with 1,000

Percentage population share of that sub-Region in the world x 1,000 = SP of that sub-Region.

For example, USA (sub-Region) has 4.6% of world population.

= 4.6% x 1,000= 46 SP required

Similarly, for Scandinavian Europe

$$= 0.4\% \times 1000 = 4 \text{ SP required}$$

2. Now find out the number of SP locations for all the 40 Sub-Regions.

Sampling Exercise for 21 sub-Regions (other than G19):

Sampling was carried out in the following manner by undertaking a number of steps as below:

Step # 1:

1. List the Primary Sampling Units of all countries listed in a sub-region. Calculate the cumulative populations. Cross check that the cumulative should be equal to the total population for all the countries present in that sub-Region.

Step # 2:

This has the following sub-steps:

1. Divide the total cumulative population by the number of PSUs required. This gives the sampling interval.

$$\text{Sampling Interval} = \frac{\text{Cumulative Populations of Sub Region}}{\text{No. of sample points required for that Sub Region}}$$

2. Find a random number from the random number table ranging from 0 to the total population of the sub-region.

3. Locate the Primary Sampling Unit (PSU) whose cumulative population column is nearest to the selected random number. This would be our PSU # 1, the first sampled location for that sub-Region.

4. Now add sampling interval to this random number. You get a new number. Locate the PSU whose cumulative population is closest to this new number. Call it PSU # 2.

5. Again add sampling interval to this number and continue finding out PSUs till the required number of PSUs have been sampled.

In this way we get names and identification of level 2/3/or even lower level locations for sampling purposes.

For each of the 21 sub-Regions a table is prepared which enlists the sampled locations for that sub-Region. The following information is available for each of the PSU: Name of country; Name of level 3 (or as relevant location); Population at level 3; No. of interviews that are required from that level 3 location. Examples of such tables are available separately.

Sampling Exercise for G19 Sub-Regions of the world:

This discussion is regarding the 18 sub-Regions as Australia was covered along with the 21 sub-Regions and has been excluded from this part of the phase.

1. For each sub-Region, there are certain numbers of units which enlist the population available for the smallest possible administrative unit of that country.
2. Find out the cumulative populations.
3. As we already know the total number of PSUs required for this sub-Region, we will find out the sampling interval by dividing the cumulative population by the number of PSUs required.
4. Find out a random number, from the random number table, lying between 0 and the total PSUs of the single country sub-Region. This will be our PSU#1.
5. Locate which cumulative is closest to that random number and make it as PSU # 1.
6. Add sampling interval to that random number, find next PSU and continue.
7. The details of this Population Proportionate to Size (PPS) sampling procedure have been described above.

For each sub-Region, sampled locations will be identifiable through its administrative hierarchy. For example, in India a sampled sub-District will contain information on the district of which it is a part, and the state of which that district is a part.

Examples:

All of the above steps are part of a Computer Software which generates Sampling Points. An Exercise designed to select 1000 Sampling Points shows that they fall in 117 countries; the 60 countries got randomly excluded from the selection as a result of their lower probability to be selected in a world-wide selection of 1000 locations. But since they had a probability to be selected they would be deemed to be part of the universe. If we look at the two sets of 1000 locations, included as appendix to this paper, the list of countries which form part of the selected sample is slightly different in each, because each is based on the principle of random selection.

Global Population Census

What does it contain?

- 1** - A consolidated Population Census of nearly 177 countries
- 2** - The consolidated census approximates 'Google Earth' of Population census, meaning that you can narrow down your search for a country population by its lower level units and get the names and population sizes. In due course other demographic information will be available as well.
- 3** - This type of a consolidated global census information does not exist at present (to the best of our knowledge)
- 4** - The consolidated global census is an essential tool for conducting truly global surveys. (as distinct from international surveys of a certain set of countries in the state-centric model)

Global Demographic Database

Introduction:

This is a database which gives information on key **socio demographic variables** for **177 countries** of the world. This information is readily accessible and can be grouped to obtain regional figures as required by each Researcher or User. The ability of being customized according to the needs of Global Survey Researcher makes it unique.

What does it contain?

This has information for the following list of socio demographic variables for 177 countries of the world:

- Population,
- Population growth,
- Age distribution,
- Literacy,
- Nationality,
- GDP,
- Income, and
- Religion.

Although this information is available at other places as well (details are mentioned in the sources of this software), but the unique feature is that this data can be analyzed in terms of any groupings as desired by the Researcher. The Researcher can combine any number of countries and get **regional percentages** on these variables for his or her **self-created groups**. Moreover, regional percentages on the regions, sub-Regions etc. as defined earlier in the paper, can also be computed very quickly.

Who does it help?

This Software is meant to facilitate any Individual/Organization involved in carrying out **Global and Regional studies**, as every sample survey requires detailed demographic information to **verify and validate** its survey findings. Moreover, often the survey findings need to be weighted according to population shares of different sub-Regions/ Regions etc. in order to make the findings truly representative of the population of the Region/sub-Region they are trying to capture. Again, this needs the availability of demographic information for the Region/sub-Region under study.

This software also gives valuable information on the **regional patterns or similarities and differences on key socio demographic variables**. The Demographic Data Base also gives us valuable information on the Age Distributions, Dependency Ratios etc. and its pattern in the Developed and the Developing Countries.

What are its Sources?

The data in this Database has been obtained mainly from the World Bank Annual Development Report and CIA Fact book. Both sources are compilations of demographic and socio-economic data obtained from open national sources.

Looking Ahead to Expand and Update

- We plan to update the data in this database annually as per World Bank Annual Development Report Tables.
- We also plan to expand it according to other sources, such as PEW Study on World Religions.
- There is a possibility to expand it according to specialized sectors such as global environment, health (WHO Studies) and other areas. This will give another list of valuable indicators whose regional and grouped percentages etc. can be easily calculated with the help of this software.
- We also plan to coordinate with Research Institutions dealing with global studies to make this database more useful and efficient.

Global Demographic Database

What does it contain?

- 1** - It contains information on key socio-demographic variables for nearly 177 countries of the world
- 2** - The software allows you to calculate percentages for these variables for any group of countries as desired by the Research
- 3** - All this rich information on regions/countries of the world is accessible easily and quickly

Global Sampling Software

Introduction:

The global sampling software is a modest but unique product which is designed to sample the global population according to its distributions in different parts of the world in a scientific and rapid manner.

What does it contain?

- **Census Information:** It contains selected population census information for 177 countries of the world which covers more than 99.5% of the total world's population. This census information has been arranged according to the administrative units of each country. More details on the Census data are available separately.
- **Sampling Frame:** The global sampling frame consists of over 350,000 sampling units which are the smallest administrative units of nearly 177 countries respectively whose population (total number of individuals living in that administrative unit) are available in the Census. The units in the sampling frame are likely to rise beyond 1 million in due course.

We propose to do sampling at the level of sub-Regions as explained earlier. But the software has an option to sample each country level individually as well.

- **Sampling Procedure:** The software will select your desired number of sampling locations/Sampling units randomly from your selected sampling frame (sub-Region or country) by Probability Proportionate to Size (PPS) method.

You can download your selected locations to an Excel sheet where you will have following information about the sampled location: name of location and the hierarchy of administrative units above it up to the country level, sub-region, region and global zone.

Who does it help?

The software is helpful to any individual or organization conducting sample surveys at global or regional level. It is helpful to anyone interested in conducting studies in any of the 177 countries of the world.

This software will provide them a representative sample of globe/selected region in a very time efficient manner.

An Example of its application:

Suppose we want to conduct a Global Survey on Knowledge, Attitude and Practice regarding hand washing. For this we want a representative sample of global population. Our required sample size is 10,000. We plan to do 10 interviews at each location. So we need to select 1000 Sampling Locations. The

Global Census Software will give us 1000 random locations by PPS method distributed in 40 Sub-Regions according to their population shares. The entire exercise of sampling will take just a couple of hours and no specialized skill.

04

Tests of Global Sampling

This chapter sheds light on the tests conducted to verify the methodology of global sampling.

Section 1 covers the theory behind the survey tests.

In Section 2, the actual test and its practice are discussed.

Tests of Global Sampling

Theory of Tests

To check the validity and feasibility of shifting from 'state-centric' to the 'global paradigm' we require certain tests; real or simulated. Although in other small universes real life pilots and pre-tests are feasible, global sampling requires 'simulations' or mimicking of real life pilots. Therefore, we have undertaken simulations of global samples drawing upon multi-country world survey data of leading international survey institutions and social research institutions: such as PEW, GlobeScan, Gallup International, Gallup USA, etc. The simulations put together various combinations of real life respondents and compute their global averages to compare with global 'census' distributions. We have constructed several simulated samples of global population using raw data provided by multi-country surveys of above mentioned organizations.

We have conducted 10 tests or exercises. Each exercise has two components. The first component revolves around the question: Does the new (global-centric) sample capture the population demographics better, worse or the same as the conventional sample? In other words we need to check whether a sample drawn from an alternative methodology can provide more accurate results compared with the conventional approach. This amounts to gathering proof for the reliability of our 'global paradigm' model. The second objective is to investigate whether a small sample can deliver results which are as accurate as that from the larger sample. To obtain a small sample, we select every n th respondent from the database of a given survey and thus construct a smaller sample. We will match sample characteristics to the population values from our global demographic database to test the reliability of results. The demographic feature that we will be focusing on for comparing our sample with population parameters is religion, including a 'no religion' category, rather than languages which are too numerous; income, which comes in local currencies and thus harder to compare across nations; or education, which is again difficult to standardize. We will use the global religious distribution provided by the PEW Foundation.

The second test component picks up a given question from 'Test Data Base' and tests: Does the new (global-centric) sample deliver the same result as the conventional sample if both of them are re-weighted (or weighted) according to the census or demographic distribution provided in the demographic database?

If both the new and conventional samples are weighted to the same population estimates, do they deliver identical results of any given survey question. And if there is a variance, how much is the variance. For example, in the PEW survey on foreign policy attitudes, a question is based on favorability towards the United States. If conventional sample and new (global-centric) sample are both weighted to global regional and other demographic distribution, do they come up with identical responses? These tests are currently underway. The data sources which we utilize are: Pew Foundation multi-country polls, Asia Barometer and Euro barometer. In the next section we present results based on Asia Barometer data.

Practice of Tests

In this section we will demonstrate that a paradigm shift has remarkable benefit in terms of cost, speed and efficiency. The test chosen for this paper is on Asia Barometer data.

Tests on ASIA Barometer Surveys

The Asia Barometer has conducted several rounds of surveys in Asian countries. We have merged the data for the waves of 2004, 2005, 2006 and 2007. Together for the four waves we have a total of **28** countries and the sample size is equal to **35,409** men and women.

Alternative samples by global-centric sampling method

We use our global-centric sampling methodology (let us call it GCM) to see whether smaller samples would be equally efficient to give estimates of Asia's opinions within its major sub-regions. We make random selections from the Asia Barometer sample (N=35,409) to choose three versions of the GCM samples with the Asia Barometer sample (we call it the Asia Barometer large sample) and compare the values. The data suggests that GCM samples pass the test for the Asian figures almost entirely. The reliability of GCM Full sample is higher than GCM Medium sample and GCM Mini sample. Similarly, the reliability is in the acceptable range but gets reduced when we analyze the data for sub-regions of Asia. Below we explain the entire process.

Asia Barometer (Large) Sample	No. of countries included in respective wave
Wave 1: n = 8086	10
Wave 2: n = 12241	14
Wave 3: n = 8070	07
Wave 4: n = 7012	07
Combined Sample: n = 35409	28 (unduplicated)
GCM Sample Sizes	
GCM Large sample:	
Global sample (as per our Method):	n = 10,000
For any specific region, Asia in this case	n = 5,758

GCM Medium sample (In case Large Sample is not affordable):	
Global sample:	n = 5,000
For any specific region, Asia in this case	n = 2,878
GCM Mini sample (in case an even smaller sample is required):	
Global sample:	n = 2,500
For any specific region, Asia in this case	n = 1,154

Test A: Asia Barometer - GCM (Full) Sample:

Our first test is to compare the estimates of the large sample with the GCM Full sample. We have a sample equal to 5758. This size is what would have been the share of sample in this part of the world (the 28 countries covered by the Asia Barometer) had we done a global survey with the GCM sample size of 10,000. The first two columns of the table show the figures are almost the same especially at the total level. For segmentation analysis, we look at the figures for regions and it is evident that they are approximately similar in both samples also. This proves that small sample is as efficient as large sample as a random selection of 5,758 cases out of 35,409 gives a result close to the weighted version of large sample.

Test B: Asia Barometer - GCM (Medium) Sample:

We proceed to the test of GCM Medium sample. The estimates from this sample are close to the larger sample but not as accurate as the GCM Full sample. The differences are more at the segment level than at the total level.

Test C: Asia Barometer - GCM (Mini) Sample:

Our third test employs an even smaller sample: GCM Mini sample. In this case, the total figures are still similar in both large and small samples but at segment level they seem to differ in some cases. For example, in West Asia 34% people are neither happy nor unhappy when we look at the 5758 sample, 35% in the large sample and 41% in the 1000 sample. So there is a discrepancy in this case.

Therefore, we conclude that 5,758 is an optimal sample size in which the GCM Full sample conveys the information as precisely as the larger sample. However, for smaller samples, there are discrepancies at the segment level. The GCM Medium and GCM Mini sample should be used selectively considering that while they give reliable information at the total sample level, the reliability declines for analysis at the sub-regional level.

Table 1
Traditional State-centric Sample
(Findings on Net happiness)

Total Sample (N = 35,409)

	Traditional state centric sample for 28 countries	Traditional state centric sample for 28 countries	Traditional state centric sample for 28 countries	NET HAPPINESS Happy minus Unhappy = (1) - (3)
	(1) Happy	(2) Neither happy nor unhappy	(3) Unhappy	
Total	64%	27%	9%	55%
West Asia n= 6760 / 503 / 252 / 101	47%	35%	17%	30%
South Asia n= 8903 / 2099 / 1050 / 420	71%	22%	8%	63%
East Asia n= 10457 / 794 / 396 / 160	68%	24%	7%	61%
North Asia n= 9289 / 2362 / 1180 / 473	60%	23%	8%	52%

Table 2
Comparison of Traditional State-central Sample with Alternate Sampling Method
(Variances between findings of state-centric and 3 versions of global-centric samples)

	Traditional state centric sample for 28 countries n=35,409	GP sample FULL version n=5,758	GP sample MEDIUM version n=2,800	GP sample MINI version n=1,154	Variances from total sample of N=35,409
	Net Happiness	Net Happiness	Net Happiness	Net Happiness	Net Happiness
Total	55%	57%	57%	55%	0 - 2%
West Asia n = 6760 / 503 / 252 / 101	30%	35%	36%	38%	5 - 8%
South Asia n= 8903 / 2099 / 1050 / 420	63%	64%	62%	60%	1 - 3%
East Asia n= 10457 / 794 / 396 / 160	61%	62%	60%	53%	1 - 8%
North Asia n= 9289 / 2362 / 1180 / 473	52%	55%	55%	56%	3 - 4%

(The regional samples would be smaller than the global samples and would depend on the countries being covered. The above are for global samples comprising of 28 countries.)

Conclusion

Our view is that a global sample of 10-20,000 men and women would provide a sound sample at the global level and a fairly sound segment analysis separately for each one of the G-20 countries (19+ other EU) as well as the rest of the world clubbed into 20 sub-regional groups. Thus global opinion for the world as a whole and its 40 constituent units can be measured through a relatively small sample (say 10- 20,000), at an affordable cost and fairly rapidly, within a week if need be.

Following the same logic, Regional polls can be organized by selecting regional samples through the global-centric method. We are currently working on a proposal with Asia Barometer to conduct an Asia Poll through the global-centric method.

The key theoretical issue raised by the paper pertains to the specification of a 'universe' of the population whose 'sample' is to be selected. The paper argues that most global and regional polls fail to specify any multi-country universe. Consequently they are unable to project their 'estimates' to a specific 'population'. Furthermore, they are unable to be analyzed as time series data and provide trend data because successive rounds of the same surveys miss out on some of the countries. The Method Proposed in our paper rectifies this problem of global and regional polls. The 'estimates' obtained from our global (world) poll or regional poll will be projectable to their respective regional or global populations. They could also be replicated over a period of time to provide trend data for global or regional populations.

***(Foot-note)* Two Variants of the Recommended Sample Sizes:**

A carefully structured, and suitably weighted, sample of 10,000 should be able to provide statistically relevant results for global populations and up to 20 regional segments; whereas a sample of 20,000 should do that for up to 40 regional segments including statistically relevant results for all G20 countries at individual country level.

1000 Locations for a Global Poll

Selected through Global-centric Sampling approach

Dr. Ijaz Shafi Gilani

July 02, 2013

Introduction

The procedure to select these 1000 locations is explained in the text of the paper. The selection has been made through our global sampling software. As a preliminary exercise, there are several limitations which we hope to overcome in due course of time. These limitations are:

Limitations:

- 1** - The global census (compiled from web access) is neither perfect nor completely up to date.
- 2** - Due to limited access to complete census information, the PSU, or sampling location, is not at the same level of detail for every country. This problem can also be overcome as we improve the quality of our global census.
- 3** - As a first attempt the execution of the preliminary exercise may contain certain flaws not spotted by us. We would greatly appreciate any feed-back and will try to rectify any errors or flaws.

Synopsis of the Preliminary Exercise:

- 1** - At this stage global census data contains 347,760 Primary Sampling units, across 177 countries of the world, representing more than 99% of the global population.
- 2** - The Exercise was designed to select 1000 Primary Sampling Units through Population Proportionate to size (PPS) method.
- 3** - Before making the selection we stratified the 177 countries into 40 strata. These included 19 single country strata and 21 multi-country (sub-regional) strata.
- 4** - The software generated a list of 1000 locations along with their total population figure and geographical markers.

5 - Boosters and re-adjustments in sub-regional sample sizes

The paper has elaborated upon a method by which all G20 countries will be self-representing units in this exercise, with a sample size sufficient to produce statistically significant results. The same logic will apply to the remaining multi-country sub-Regions.

Preliminary Example
1000 Locations for a Global Poll

Selected through Global-centric Sampling approach
Dr. Ijaz Shafi Gilani, July 2, 2013

Set # 1: (a Set # 2, replicate of this set, appears ahead)
